Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of claims:

- 1 - 11. (cancel)
12. (new) A method for verifying a signature for a message m in a data communication system established between a sender and a recipient, said sender generating masked signature components (r, s, c) , where r is an integer derived from a coordinate of a first short term public key kP , s is a signature component derived by binding a second short term private key, the message m and short and long term private keys, and c is a second signature component obtained by combining said first and second short term private keys, said method comprising the steps of a verifier:
- a) obtaining a pair of signature components (\bar{s}, r) , said component \bar{s} being derived from said first and second signature components generated by a signor;
 - b) recovering a coordinate pair (x_1, y_1) corresponding to said first short term public key kP using said pair (\bar{s}, r) and said message m ;
 - c) calculating a signature component r' from one of said coordinate pairs; and
 - d) verifying said signature if $r' = r$.
13. (new) A method according to claim 12 further comprising the step of said verifier receiving (r, s, c) from said signor and converting (s, r, c) to obtain said pair (\bar{s}, r) .
14. (new) A method according to claim 12 further comprising the step of said signor converting (s, r, c) to said pair (\bar{s}, r) and said signor sending said pair (\bar{s}, r) to said verifier.
15. (new) A method according to claim 12 wherein said coordinate pair (x_1, y_1) is calculated using a pair of values u and v , said values u and v derived from said pair (\bar{s}, r) and said message m .

16. (new) A method according to claim 15 wherein said coordinate pair (x_1, y_1) is calculated as $(x_1, y_1) = uP + vQ$, wherein P is a point on an elliptic curve E and Q is a public verification key of said signor derived from P as $Q = dP$.
17. (new) A method according to claim 15 wherein said value u is computed as $u = \bar{s}^{-1}e \bmod n$ and said value v is computed as $v = \bar{s}^{-1}r \bmod n$, e being a representation of said message m .
18. (new) A method according to claim 17 wherein e is calculated as $e = H(m)$, $H(\)$ being a hash function of said signor and being known to said verifier.
19. (new) A method according to claim 12 wherein said coordinate x_1 is first converted to an integer \bar{x}_1 prior to calculating said component r' .
20. (new) A method according to claim 19 wherein said component r' is calculated as $r' = \bar{x}_1 \bmod n$.
21. (new) A method according to claim 12 wherein prior to calculating said component r' , said coordinate pair (x_1, y_1) is first verified, whereby if said coordinate pair (x_1, y_1) is a point at infinity, then said signature is rejected.
